

The Black Hole, is a Falling Star!

N.B.

*The Arabic version of the article is the reference,
read it on one of the following links:*

[الثَّقْبُ الأَسْوَدُ، وفرضيَّةُ النَّجْمِ السَّاقِطِ](#)

[The Black Hole, is a Falling Star!](#)

*I have always believed the black hole to be a giant star,
that falls onto the earth at a speed equal to or greater than the speed of
light. With such speeds, the observing earth eye cannot detect the star
itself. Actually, it sees the shadow of the falling star and not its mass.
The falling star looks dark thanks to the luminous background of the
space, which is filled with billions of shinny stars.*

For more details, see the linked video:

Discussion:

The First Possibility:

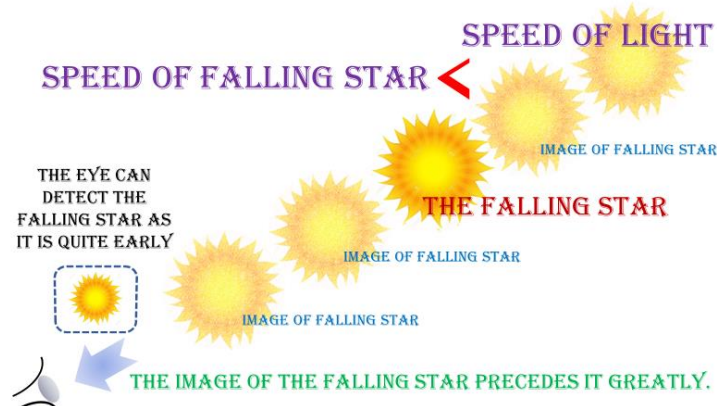

Figure (1)

*The speed of the falling star is smaller than the speed of light
"The image of the falling star precedes the star's mass itself."*

Assume with me the falling star is moving at a speed that is less than the speed of light. Since the light travel at great velocity, the star's image will arrive to us quite in advance than the star itself. This is an axiom that cannot be disputed.

The Second Possibility:

Figure (2)
The speed of the star's fall equals the speed of light
"The falling star wears its image and goes together side by side"

*If the falling star's velocity is equal to the speed of light.
 Then, the falling star as well as its image will travel together side by side along the trajectory.
 In other words, the image of the falling star will stick to the star mass itself.
 Therefore, an eye on the other end of the fall's trajectory, i.e., on the earth, will see the falling star only when the star collides with the earth, which is not a consequence.*

The Third Possibility:

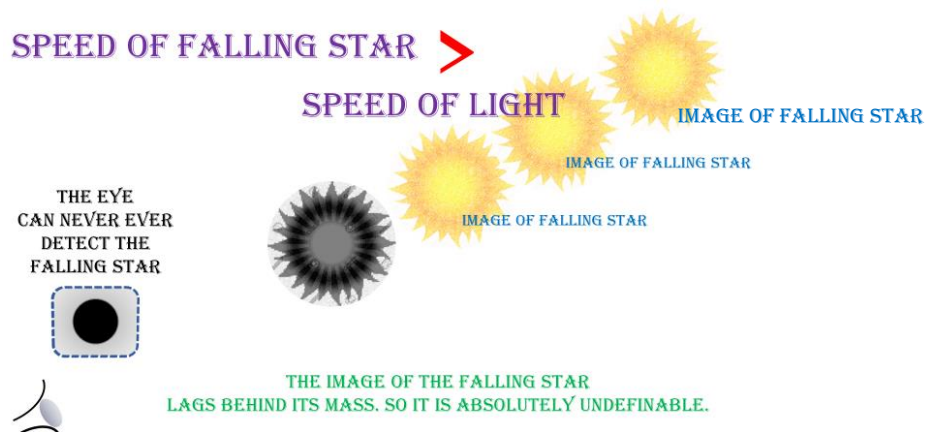

Figure 3
The star's fall speed is greater than the speed of light
"The image of the falling star lags behind the star's mass"

*Assume that the falling star's velocity exceeds the speed of light.
 Then, the falling star will free from its image, and travel widely in ahead. The star's image will pant behind the star, and it will never catch it up. Therefore, no one on the earth can see the falling star.
 When the image of the falling star reaches the earth, it will find no one to see it at that time.*

The Conclusion:

I do believe, there is a giant star that falls on us with a tremendous speed that exceeds, or equals, the speed of light. The mass of the star precedes its

image, or sticks to it. Therefore, the eye plunges into the darkness. This is because of the insufficiency of the human's eye. It does not accept anything but the light as evidence of existence.

Someone might say, is it possible? I say, yes. God Almighty promised us to see His Signs in Heaven and in ourselves. Another may say, is it the time for this falling star to reach us, as it has reached a such tremendous speed?! I tell him, don't worry. It will inevitably come to us. Just wait, I'm waiting with you.
